

JOURNAL OF BIOLOGICAL EDUCATION

CONTENIDO

VOLUMEN 43 No. 4, 2009

IN THIS ISSUE

EDITORIAL

- 147 **The importance of research in educational change in Germany.**
“When asked to explain the kind of work we do as researchers in biology education, I often use the term ‘research reforming practice’ .”
Marcus Hammann, Germany.

REVIEWS

- 149 **Causal and teleological explanations in biology.**
This paper aims to suggest ways in which students can be taught to differentiate between causal and teleological explanations, for example, through the specific ways in which questions can be phrased, and by explicitly teaching students to identify the cause and significance of biological events.
Cheng-Wai Yip, Singapore.
- 152 **Plant nutrition in Spanish secondary textbooks.**
In this paper, the authors analyses the conceptual contents related to plant nutrition in the widely-used school texts of six Spanish publishers. Not all of the texts promote the development of a global conception of plant nutrition.
Cristina Martínez-Losada, Spain.

EDUCATIONAL RESEARCH

- 159 **Representations of the human circulatory system.**
This paper analyses the extent to which students, with varying degrees of biology instruction and of different ages, have been able to change their intuitive beliefs into scientific representations of the workings of the human circulatory system.
Asunción López-Manjón and Yolanda Postigo Argón, Spain
- 164 **The influence of emotion on students’ performance in dissection exercises.**
This paper addresses the issue of how emotions like disgust influence students’ self-belief in terms of mastering a dissection task and also how these affect their interest in the biology of the heart.
Nina Holstermann, Dietmar Grube and Susanne Bögeholz, Germany.

169 **Field biology experiences of undergraduate students: the impact or novelty space.**

Previous research suggests that the novelty of being in an unfamiliar field environment can negatively, as well as positively, impact on the student experience and learning. This research uses the framework of novelty space to explore the student experience of an undergraduate biology field course to South Africa.

Debby Cotton and Peter A Cotton, UK.

CASE STUDIES

175 **Charles Darwin goes to school: the role of cartoons and narrative in setting science in an historical context.**

Scientific literacy can be considered a new goal of science education and the epistemological gap between natural sciences and literacy disciplines must be overcome. The history of science is a possible bridge to link these ‘two cultures’ and can foster an interdisciplinary approach in the classroom.

Paulo Roberto Costa da Silva, Paulo Rogério Miranda Correia and Maria Elena Infante-Malachias, Brazil.

181 **‘A Bottom up’ approach to food web construction.**

The ability to comprehend trophic (nutritional) relationships and food web dynamics is an essential part of environmental literacy. However, students face severe difficulties in grasping variety of causal patterns in food webs.

Dorita Demetriou, Konstantinos Korfiatis and Constantinos Constantinou, Cyprus.

REGULAR ITEMS

188 **Books**

191 **Index, Vol. 43**

ON THE COVER

Japanese Maple, autumn leaves (*Acer palmatum*).
